

PRE-PRODUCTION TASKS & POSTERS

Version 1.0
BSc Computing for Games
COMP230

Dr Michael Scott

Introduction

This is your final year game development project. It is a major undertaking, affording the opportunity to present a portfolio piece that showcases what you have learned across the degree. There are many configurations for this work. You can: (i) join an existing game development team as a 'technical specialist' to work on one or more game components; (ii) act individually as a 'consultant' for multiple BA teams to work with one particular emerging technology—delivering a tech demo; (iii) form your own team, extending your research projects and integrating them into an original game as cutting-edge game components; or (iv) work as an individual to develop a game-making tool or game middleware. Use any programming language or technology the Games Academy has access to.

Gaming is a diverse ecology. Experiencing different roles and cross-disciplinary challenges is important. Computing professionals frequently encounter them.

This assignment is formed of several parts:

- (A) **Implement**, as an **individual or group**, an initial pre-production prototype of the product which will:
 - i. **illustrate** the project's core objectives, features, and unique selling points.
- (B) **Implement**, as an **individual or group**, a final pre-production prototype of the product which will:
 - i. **revise** any issues raised by your product owner and/or your peers.
- (C) **Prepare**, as an **individual**, an A3 poster which:
 - i. **outlines** the core features and unique selling points of your project;
 - ii. **illustrates** your individual contribution.
 - iii. and **justifies**, where relevant, the market need for the project—whether research **or** enterprise.
- (D) **Present**, as an **individual**, a 'poster demo' that will:
 - i. **clarify** the product and its design, as shown in the poster;
 - ii. and **demonstrate** the final pre-production prototype.

*"You don't make money by
working on things;*

*You make money by shipping
things."*

— Dave Lang

*"To evoke emotions through
art, in games or anything else
you have to break down your
medium. What's the minimal
amount of information we
can use to tell you what you
need to know about an
object?"*

Use that, and no more."

— Luis Antonio

The team behind *Portal* were once students and were hired by Valve when they graduated on the basis of their final year game project *Narbacular Drop*.

Assignment Setup

This assignment is a **product development task**.

There is no defined method of version control or repository.

If you are not working with other students, you are a group of one. As such, all references to group, collaborative, and/or teamwork activities refer to yourself as an individual. Involving BA students in such activities is optional.

Part A

Part A is formed of **multiple formative submissions**. This work is either **individual** or **collaborative** depending on your mode of work. You will be assessed on a **threshold** basis. The following criteria are used to determine a pass or fail:

- (a) Playable builds are made available in a timely manner;
- (b) Enough work is available to conduct a meaningful review.

To complete Part A, prepare draft versions of the pre-production prototype ahead of the **sprint review meetings** with your product owner. Ensure that the source code and related assets are made available prior to **EACH** scheduled meeting. Then, attend the scheduled meetings.

You will receive immediate **informal feedback** from your **product owner**.

Part B

Part B is a **single summative submission**. This work is either **individual** or **collaborative** depending on your mode of work. It will be assessed on a **criterion-referenced** basis. Please refer to the marking rubric at the end of the brief for details on the criteria.

To complete Part B, revise the pre-production prototype based on the feedback you have received and finish any incomplete features. Then, upload the source code to the LearningSpace. If you are working with an existing game development team, they will submit the final executable build physically. Otherwise, you must include a link to your build in your submission to the LearningSpace. Please note, the LearningSpace will only accept a single .zip file.

You will receive **formal feedback** three weeks after the final deadline.

Part C

Part C is a **single summative submission**. This work is **individual** and will be assessed on a **threshold** basis. Ensure the presentation addresses the following:

- The title and high concept of the product
- The target audience and market
- The concept's unique selling points and how they distinguish it from competitors
- The design's technical and production feasibility
- The project's commercial feasibility

To complete Part C, prepare the poster using any word processing and/or presentation tool. Then, upload the relevant files to the LearningSpace. Please note, the LearningSpace will only accept a single .zip file.

You will receive **informal feedback** from your tutor during Part D.

Part D

Part D is a **single summative submission**. This work is **individual** and will be assessed on a **criterion-referenced** basis. Please refer to the marking rubric at the end of the brief for details on the criteria.

To complete Part D, practice the delivery of the poster demo. Ensure that you are comfortable with the presentation medium and discuss any concerns with your tutor. Then, attend the scheduled poster demo session. Please ensure that you print out and bring your poster to the session. Please, also ensure that you setup a workstation with the pre-production demo ahead of time.

You will receive **formal feedback** three weeks after the poster-demo session.

Additional Guidance

Avoid poor planning and time management. By now this will be a familiar phrase, but it is no less true. In particular, avoid underestimating the effort required to implement even simple software; always consider scope. From the pitch stage, you should consider very carefully what is feasible.

For the most part, your work will be marked as a group effort. However we want to avoid the situation where students try to “coast” through the assignment on their fellow group members’ work, and equally the situation where one member of the group takes the lion’s share of the work and prevents the others from contributing effectively. Marks will be weighted by a multiplier for **individual contribution**, which aims to penalise both of these behaviours. We assess this by several means, including but not limited to: sprint reviews; individual vivas; feedback from your peers; attribution in the source code; and GitHub commit logs. Any student who has contributed their *fair share* of effort to the project will receive a fair % for their effort, so any student who is putting in the appropriate level of effort has no need to worry. Note that effort is not the same as productivity.

The first step in planning your implementation should be to break your concept down into **user stories**. Your user stories should be **distinguishable** (i.e. there should be little overlap between them) and **easily measured** (i.e. it should be easy to tell when each user story has been implemented). They should also be **comprehensive**, i.e. the user stories should completely capture the desired functionality of the game, with no gaps. Imagine giving your user stories to a developer who has never seen a product of this type before. Would they be able to implement the software correctly, or would they miss key features?

Your code will be assessed on **functional coherence**: how well the finished product corresponds to the user stories, and whether it has any obvious bugs. Correspondence to user stories runs both ways: implementing features that were not present in the design (“feature creep”) is just as bad as neglecting to implement features.

Your code will also be assessed on **sophistication**. To succeed on a project of this size and complexity, you will need to make use of appropriate algorithms, data structures, libraries, and object oriented programming concepts. Appropriateness to the task at hand is key: you will **not** receive credit for complexity where something simpler would have sufficed.

Maintainability is important in all programming projects, but doubly so when working in a team. Use **comments** liberally to improve code comprehension, and carefully choose the **names** for your files, classes, functions and variables. Use a well-established commenting convention for **high-level documentation**. The open-source tool Doxygen supports several such conventions. Also ensure that all code corresponds to a sensible and consistent **formatting style**: indentation, whitespace, placement of curly braces, etc. Hard-coded **literals** (numbers and strings) within the source should be avoided, with values instead

defined as constants together in a single place. Consider allowing some literal values, where appropriate, to be “tinkered” without changing the source code, e.g. by defining them in an external file read at startup.

As with all assignments on this course, you are expected to display a level of **innovation and creative flair** befitting Falmouth University’s reputation as a world-leading arts institution. We are looking for creativity; but, you will **not** be judged on the quality of your art assets. One approach to promoting creativity is **divergent thinking**: generating ideas by exploring many possible solutions. Often the most interesting ideas are **subversive**: they deliberately go against convention or obvious solutions.

FAQ

- **What is the deadline for this assignment?**

Falmouth University policy states that deadlines must only be specified on the MyFalmouth system.

- **What should I do to seek help?**

You can email the module leader for informal clarifications.

- **Is this a mistake?**

If you have discovered an issue with the brief itself, the source files are available at:

<https://github.com/Falmouth-Games-Academy/bsc-assignment-briefs>.
Please create an ‘issue’ and comment accordingly.

Marking Rubric (Pre-Production Prototype)

Criteria marked with a ‡ are shared by the group. Criteria marked with a † are weighted by individual contribution to a shared deliverable. All other criteria are individual.

Criterion	Weight	Refer for Resubmission	Novice Competency	Novice Proficiency	Professional Competency	Professional Proficiency	Expert Competency
Sprint Reviews	40%	Inadequate participation in sprint reviews.	The student participates adequately in all sprint reviews (excepting mitigating circumstances). A meaningfully playable build is available in most sprint reviews.				
Progress	15% †	There is no working build or the build has little to no functional coherence. Only some user stories have been implemented. Set sprint goals set were tenuous or otherwise inappropriate.	Many user stories have been implemented. There is some evidence of feature creep. Somewhat appropriate sprint goals were set.	Almost all user stories have been implemented. There is little evidence of feature creep. Somewhat appropriate sprint goals were set.	All user stories have been implemented. There is almost no evidence of feature creep. Appropriate sprint goals were set.	All user stories have been implemented. There is no evidence of feature creep. Appropriate sprint goals were set.	All user stories have been implemented. There is no evidence of feature creep. Well-scoped sprint goals were set, providing considerable focus to the project and aiding productivity.
Value	15% †	Contributions are a poor fit to the overall project goals.	Contributions are a somewhat adequate fit to the overall project goals.	Contributions are an adequate fit to the overall project goals.	Contributions are a good fit to the overall project goals and enhance the outcome.	Contributions are a good fit to the overall project goals and considerably enhance the outcome.	Contributions are a good fit to the overall project goals and significantly enhance the outcome.
Professionalism	10% ‡	The group has demonstrated no, little, or only some professionalism. Agile practices have not been used, or were implemented in such a way they provided only some support for the project.	The group has demonstrated much professionalism, functioning somewhat effectively in a team and/or customer engagement context. Agile practices have provided much support for the project.	The group has demonstrated considerable professionalism, functioning somewhat effectively in a team and/or customer engagement context. Agile practices have provided considerable support for the project.	The group has demonstrated significant professionalism, functioning somewhat effectively in a team and/or customer engagement context. Agile practices have provided significant support for the project.	The group has demonstrated extensive professionalism, functioning somewhat effectively in a team and/or customer engagement context. Agile practices have provided extensive support for the project.	The group has demonstrated extensive professionalism, functioning somewhat effectively in a team and/or customer engagement context. Agile practices have provided extensive support for the project. There is evidence that the team are engaged in research-led practice or research-driven practice.
Application of Specialist Skills & Polish	20% †	Product will not execute at all on another machine, for reasons related to code portability, even if they are trivially resolvable. There is only some insight into code sophistication evident in the source code. There is only some insight into code maintainability evident in the source code.	Some portability issues are present. Much insight into code sophistication is evident in the source code. Much insight into code maintainability is evident in the source code.	Few portability issues are present. Considerable insight into code sophistication is evident in the source code. Considerable insight into code maintainability is evident in the source code.	Almost no portability issues are present. Significant insight into code sophistication is evident in the source code. Significant insight into code maintainability is evident in the source code.	No portability issues are present. Extensive insight into code sophistication is evident in the source code. Extensive insight into code maintainability is evident in the source code.	No portability issues are present. Much evidence that portability has been considered in the design of the software architecture. Extensive insight into code sophistication is evident in the source code. Extensive insight into code maintainability is evident in the source code. Some evidence of novelty and originality in the software architecture, commensurate with cutting-edge practice.
Individual Contribution	Multiplier for criteria marked †	Little to no evidence of individual contributions to source code.	Some evidence of individual contributions to source code.	Much evidence of individual contributions to source code.	Considerable evidence of individual contributions to source code.	Significant evidence of individual contributions to source code.	Extensive evidence of individual contributions to source code.

Marking Rubric (Project Pitch — Poster-Demo)

Criteria marked with a ‡ are shared by the group. All other criteria are individual.

Criterion	Weight	Refer for Resubmission	Novice Competency	Novice Proficiency	Professional Competency	Professional Proficiency	Expert Competency
Basic Competency Threshold	40%	No poster-demo is delivered, or either is inappropriate. There is no executable and working build of the project. There is evidence of academic misconduct.	A broadly appropriate individual poster and demo is on display during the demo day. A working build is available.				
Pre-Production Demo	30%	There is no demo, or the demo fails to adequately illustrate the concept.	The product concept is described with some adequacy.	The product concept is concisely described with much adequacy. The use of figures and tables is somewhat effective.	The product concept is concisely described with considerable adequacy. The use of figures and tables is quite effective.	The product concept is concisely described with significant adequacy. The use of figures and tables is very effective.	The product concept is concisely described with extensive adequacy. The use of figures and tables is extremely effective.
Poster	30%	Delivered with little enthusiasm. Little connection with the audience. The product concept has been articulated with little clarity.	Delivered with some enthusiasm, conveying a basic argument. Some connection with the audience. The product concept has been articulated with some clarity.	Delivered with much enthusiasm, conveying a persuasive argument. Much connection with the audience. The product concept has been articulated with much clarity. The aesthetics have impact.	Delivered with considerable enthusiasm, conveying a persuasive argument. Considerable connection with the audience. The product concept has been articulated with considerable clarity. The aesthetics have considerable impact.	Delivered with significant enthusiasm, conveying a very persuasive argument and passion for the project. Significant connection with the audience. The product concept has been articulated with significant clarity. The aesthetics have significant impact.	Delivered with extensive enthusiasm, conveying a very persuasive argument and passion for the project. Extensive connection with the audience. The product concept has been articulated with extensive clarity. The aesthetics have extensive impact.
